

Environmental and energy principles

- Waste prevention → if no prevention appropriate recycling and disposal
- Saving energy and raw materials
- Selection of production processes and materials, taking into account environmental and energy aspects as well as occupational health and safety
- Protection of employees and residents from noise pollution
- Reduction of hazardous substances
- Dealing with resources under consideration, always the least possible load
- Consideration and compliance with the requirements derived from the collection "interested parties"
- Analyzing and evaluate environmental impacts
- Compliance with the targets from the energy assessment
- strengthen suppliers and employees in the environmental factor in the interplay of supply and demand
